

“NETMONASTERY delivers effective security solutions, which define the future and dares to remain unsurpassingly unique in features”

Overview

“NETMONASTERY NSPL” is a leading provider of threat management solutions. For over a decade, we have been delivering research based security solutions to enterprise networks. So far we have churned out three products. The first one, an intrusion prevention system, was used in mission critical projects. This was followed by a DDoS detection and prevention system for the enterprises. Our final product is CNAM (Comprehensive Network Attack Monitoring).

CNAM, our flagship threat management service, provides highly accurate threat detection and application integration to our customers. Our team consists of leading application researchers who have rolled out complex attack detection algorithms into automated modules that detect threats in real-time.

Research Areas

- **Traffic Anomaly Engines** detect advanced infrastructure attacks and persistent threats
- **Worm Outbreak Engine** collaborates to identify spreading malware in real-time
- **Application Integration and Measurability** covers application threats comprehensively

Highlights

A number of customers have benefited from our services. Some of the largest telecoms, exchanges, banks and financial institutions form the list of our esteemed clients. However, our privacy policy restricts us from naming them in the public domain. We would be glad to provide as many references as required on request.

NETMONASTERY is proud to be the foremost detection system used for the CWG games website. This site saw more than 7000 active attackers in 18 days, thereby upholding our record of zero compromises since the inception of the service.

CNAM was given the Aegis Graham Bell Award 2012 for Innovation in Cloud Service.

We have been associated with NETMONASTERY for five years now and it's fair to say that CNAM has skillfully dealt with attacks - both, pro-actively and reactively.
